THINKWARE launches a new fleet management system, Connected Service, at the Commercial Vehicle Show

The THINKWARE Connected Service makes monitoring, downloading, and accessing recorded footage easier than ever through dedicated mobile and PC applications

May 24, 2022 – Today, the world-leading dash cam manufacturer, THINKWARE announces the launch of its new fleet management system (FMS), THINKWARE Connected Service, for the UK market.

THINKWARE are helping to manage fleets by making monitoring, downloading, and accessing recorded footage easier than ever with the dedicated THINKWARE Connected Service.

Launching at the UK's Commercial Vehicle Show, the Connected Service is available with the Q1000 and T700 dash cams and offers a variety of features to aid with fleet management, as well as protecting both drivers and vehicles.

THINKWARE Remote Live View enables users to view real-time footage of their vehicles in both 'continuous recording mode' and 'parking mode' with a click of a button. If an accident does occur, the SOS emergency contact messaging feature will automatically communicate with the registered emergency contact number via SMS on major impact, or manually via the SOS button on the camera. The SMS contains the vehicle location on Google maps plus a short video clip of the event. For individual customers, the SMS also includes the driver's mobile number, so that an emergency response centre can call them to offer assistance.

Real-Time Parking Impact detection protects vehicles while parked by detecting impacts and notifying the driver via the app. The dash cam will automatically save footage 10 seconds before and after impact that can be accessed easily and remotely via the mobile and PC applications.

For the more day to day elements of fleet management, THINKWARE Vehicle Status & Driving History monitors the vehicle's motion status, including vehicle battery voltage. It also monitors driving history, with data analytics on driving behaviour and travel history with date, time, and journey distance.

Other features include:

- Photo upload of the last parking location
- Multi-device location tracking for whole fleet monitoring
- Remotely sharing a driving route
- ADAS forward collision, vehicle departure and lane departure warning, plus safety camera alerts, using a database provided by our partner Cyclops.

Tailored to different customer needs, the THINKWARE Connected Services consists of three different modes with "ENTERPRISE" providing an all-in-one service for enterprise customers that is ideal for fleet management. There is also "SMART" mode which is suitable for individuals who want the most value for money and "HOME", a family oriented mode that allows for up to 5 members.
